# Who Are We?

Jason Prothero

CEO / Lead Developer

Umbraco Master

Mark Bowser

Software Developer

Umbraco Master

# Who Are We?

- Started using Umbraco in 2009 - version 4.0.3
- Built many sites of various sizes and types
- Inherited several sites to maintain and extend

# Design Patterns

*In software engineering, a design pattern is a general repeatable solution to a commonly occurring problem in software design.*

*-- [https://sourcemaking.com/design\\_patterns](https://sourcemaking.com/design_patterns)*

# What is an Anti-pattern?

*An antipattern is just like a pattern, except that instead of a solution it gives something that looks superficially like a solution but isn't one.*

*-- Andrew Koenig*

Seemed like a valid path to take at the time and only after extending or maintaining the solution do they appear as anti-patterns

Doesn't mean you're a "bad" developer

# What is an Anti-pattern?

Anti-Patterns have amazing names - <http://wiki.c2.com/?AntiPatternsCatalog>

# Umbraco Anti-Patterns

- Lava Flow
- Tower of Voodoo
- Yet Another Cache Will Solve It
- Roll Your Own API

An aerial photograph of a dark, textured lava flow. The surface is highly irregular and craggy, with numerous small, winding fissures and channels. These fissures are filled with glowing orange-red lava, creating a stark contrast against the dark, almost black, solidified rock. The overall appearance is that of a complex, branching network of molten rock. The text "Lava Flow" is overlaid in white on the left side of the image.

# Lava Flow

# Lava Flow Anti-Pattern

*“At this point, we began calling these blobs of code “lava,” referring to the fluid nature in which they originated as compared to the basaltlike hardness and difficulty in removing it once it had solidified. Suddenly, it dawned on us that we had identified a potential AntiPattern.”*

*- <https://sourcemaking.com/antipatterns/lava-flow>*

# Problem: Imperfect Information

Need to configure Umbraco to support the project. However, the site at the end of the project may not look like the requirements at the start.

- Lack of Information => Too generic
  - Parent Document Types have too many properties
- Assumption of perfect requirements => May resist change
  - When requirements change, there could be bloat locked in to your document types

# Under Architecting

# Inheritance - Extra Properties

The screenshot displays a content management system interface. On the left is a vertical navigation sidebar with icons for home, document, image, tools, settings, user, and navigation. A search bar at the top of the sidebar contains the text "Type to search...". Below the search bar is a list of content types, with "Content Page" highlighted in blue. Other content types include Areas, City, Contact, Brochure Request, Brochure Request - Digital, Brochure Request - Mail, Catalog Download Page, Content Page with Grid, Country Content Page, Cruise Featured, Destinations Featured, Quote Request Page, and Region Content Page.

The main workspace is titled "Content Page" and includes a "ContentPage" lock icon and a description field "Enter a description...". At the top right of the workspace are icons for "Design", "List view", "Permissions", and "Template". Below these are "Compositions" and "Reorder" options.

The workspace contains three content blocks:

- bodyText**: A Richtext editor with a "Loading..." status and a toolbar containing icons for undo, redo, bold, italic, underline, and strikethrough, along with a "Formats" dropdown menu.
- mainImage**: A Media Picker with a description field "Enter a description...".
- secondaryImage**: A Media Picker with a description field "Used for secondary locations like the right side image on Country Content Pages or".

Each content block has a settings gear icon and a trash can icon on its right side.

# Over Architecting

The image shows a settings interface with a left-hand navigation pane and a main content area. The navigation pane is titled 'SETTINGS' and contains a tree view of document types. The 'Content Master' category is expanded and highlighted in blue. The main content area is titled 'SEO' and contains three settings, each with a lock icon, a title, a data type, and a description with an input field.

**SETTINGS**

- Document Types
  - Advanced Component Master
  - Blog Master
  - Content Master**
    - Advanced Page Master
      - Advanced Page (level 1)
      - Advanced Page (level 2)
      - Advanced Page (level 3)
    - Homepage
    - Standard Page Master
      - Blog Landing Page
      - Blog Post
      - Login Page
      - Search Results Page
      - Sitemap Page
      - Standard Page (level 1)
      - Standard Page (level 2)

**SEO**

**pageTitle** (locked) Textstring

**Web page header title**

Use this field to override the default page title of your webpage. The default page title will be a combination of the current page node name

**metaDescription** (locked) Textarea

**Meta description**

Use this field to enter a description for your webpage. This is the information that is displayed by search engines when your website appears in a search listing. Try and keep

**openGraphTitle** (locked) Textstring

**Open Graph title**

Use this field to override the default Open Graph title of your webpage. The default

# Solutions / Considerations

*Favor object composition over class inheritance.*

*-- Design Patterns: Elements of Reusable Object-Oriented Software*

- Use Document Type Composition
- Consider Inheritance only in specific targeted scenarios
- Vary page types in anticipation of change
  - Avoid “Everything is a Content Page”
- Don’t overuse templates on a single document type

# Compositions

🔍 Type to search...

**Text Page**

Enter a description...

# Tower Of Voodoo

# Inconsistency

```
// comes with Umbraco
var createDate1 = customerQuote.GetProperty<DateTime>("createDate");

// The forerunners made these for me
var createDate2 = customerQuote.GetLocalize<DateTime>("createDate");
var createDate3 = customerQuote.GetLocalizeDate("createDate");

// I made this one because the more the merrier
var createDate4 = customerQuote.GetProperty("createDate").GetAsDateTime() ?? DateTime.MinValue;
```

# Problem: Need to query Umbraco

So many options

- ContentService
- NodeFactory
- UmbracoHelper
- Examine

# Problem: Need to query Umbraco

The old way:

- Use NodeFactory
- Use UmbracoHelper with Dynamics

The wrong way:

- Using Descendants a lot
- Umbraco management services (probably)

# Problem: Need to query Umbraco

Some right ways

- UmbracoHelper
- Examine
- Use XPath

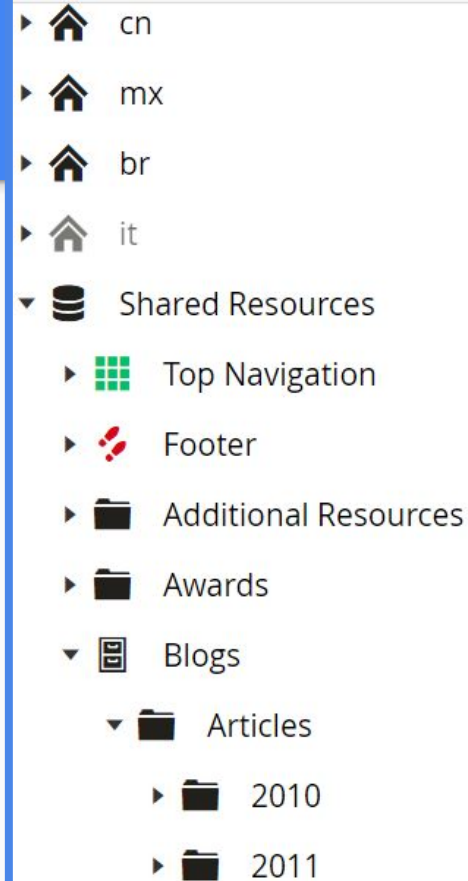

# How do I know which queries are slow?

```
var profiler = ApplicationContext.ProfilingLogger;
using (profiler.DebugDuration<UmbracoTemplatePage>("Find all blog articles - Broad XPath"))
{
    var xpath = "//BlogArticle";
    blogArticles = Umbraco.TypedContentAtPath(xpath).ToList();
}
```

# Slowest Query Countdown

- Example site
  - ~13,000 total published nodes
  - 415 published BlogArticle nodes
  - All the BlogArticles live in “Shared Resources”

# Querying with Linq using Descendants()

```
var blogArticles = Umbraco.TypedContentAtRoot()  
    .SelectMany(n => n.Descendants().Where(d => d.IsDocumentType("BlogArticle")))  
    .ToList();
```

**5697ms**

# Querying with the ContentService

```
var cs = ApplicationContext.Current.Services.ContentService;  
var blogArticles = cs.GetContentOfContentType(6012).Where(n => n.Published).ToList();
```

**1331ms**

# Querying with Linq and lots of sub queries

We know the blog articles are under **SharedResources->Blogs->Articles**

```
var root = Umbraco.TypedContentAtRoot().FirstOrDefault(n => n.IsDocumentType("SharedResourcesMaster"));
var blogMaster = root.Children().FirstOrDefault(n => n.IsDocumentType("BlogMaster"));
var blogArticleFolder = blogMaster.Children().FirstOrDefault(n => n.IsDocumentType("BlogArticleFolder"));
var blogArticles = blogArticleFolder.Descendants().Where(n => n.IsDocumentType("BlogArticle")).ToList();
```

**827ms**

# Querying with NodeFactory

```
var root = new Node(-1);  
var blogArticles = root.GetDescendantNodesByType("BlogArticle").ToList();
```

**491ms**

# Querying with Examine via TypedSearch

```
var blogArticles = Umbraco.TypedSearch("0", false, "BlogSearcher").ToList();
```

**190ms**

# Querying with Custom Examine Indexer

```
var blogSearcher = ExamineManager.Instance.SearchProviderCollection["BlogSearcher"];  
var searchCriteria = blogSearcher.CreateSearchCriteria();  
  
var query = searchCriteria.Field("inactive", "0");  
var searchResults = blogSearcher.Search(query.Compile());  
var blogArticles = searchResults.Select(r => Umbraco.TypedContent(r.Id)).ToList();
```

**167ms**

# Querying with broad XPath

```
var xpath = "//BlogArticle";  
var blogArticles = Umbraco.TypedContentAtPath(xpath).ToList();
```

**14ms**

# Querying with targeted XPath

```
var xpath = "/root/SharedResourcesMaster/BlogMaster/BlogArticleFolder//BlogArticle";  
var blogArticles = Umbraco.TypedContentAtPath(xpath).ToList();
```

**4ms**

Yet Another Cache  
Will Solve It

# Custom Caching

*There are two hard things in computer science: cache invalidation and naming things.*

*-- Phil Karlton*

# Problem: You go live and the site is SLOW...

To fix it you may:

- Create your own cache
- You make cache expirations really long (24 hours)
- Now your caching is blocking app startup (really slow)
- May have memory problems on the server
- Stovepiped cache
  - Integrated so tightly that it's a critical part of the implementation

# Solutions

- Lazy loading key settings or crucial content
  - Don't load them entirely on startup
- Try the Umbraco Cached Partials/Macros
  - Try caching for 15 minutes - something short initially
- Try MvcDonutCaching
- SiteSettings / AppSettings for key content locations
- Use tracing / performance logger to find the real source of the problem

```
<configuration>  
  <system.web>  
    <trace enabled="true"/>  
  </system.web>  
</configuration>
```

http://mysite.local/trace.axd as URL

# Roll your own API

# Custom API

*People are often aware that wrapping is a good thing as it adds encapsulation, but are not always aware that wrapping comes with a cost: an added level of abstraction.*

-- <http://wiki.c2.com/?TowerOfVoodoo>

# Problem: Duplicate Code / Code in Views

Common solutions:

- Write your own external set of extensions
- Create a “one-size-fits-all” extensions library for all your projects
- Create many “helpers” or “utilities” classes

Think about it:

- Other people have to learn this new API.
- Inconsistency
- Documentation?

```
public static IPublishedContent GetContentFromProperty(this IPublishedContent contentNode, string propertyAlias, bool recursive = false)
{
    if (contentNode != null)
    {
        // Verify this is possible (property and value exist)
        if (!contentNode.WillWork(propertyAlias, recursive)) return null;

        IPublishedContent node = null;
        var nodeId = contentNode.GetProperty(propertyAlias, recursive).GetAsInt() ?? 0;
        if (nodeId > 0)
        {
            var umbracoHelper = new UmbracoHelper(UmbracoContext.Current);
            node = umbracoHelper.TypedContent(nodeId);
        }

        if (node != null)
        {
            return node;
        }
    }

    return null;
}
```

```
var featuredBlogArticle = currentPage.GetContentFromProperty("featuredBlogArticle");
```

```
var featuredBlogArticle = currentPage.GetProperty<IPublishedContent>("featuredBlogArticle");
```

# Example: Custom GetPropertyValue

We found someone's crazy implementation that:

- In a .dll dependency without source
- Would try to localize content unnecessarily
- Would traverse the whole content tree
- Many layers deep. A box of mystery

# Solutions

- Include the source in the repository (actual version used)
- Make sure you are using the Umbraco API as intended.
  - ModelsBuilder
  - PropertyValueConverters
